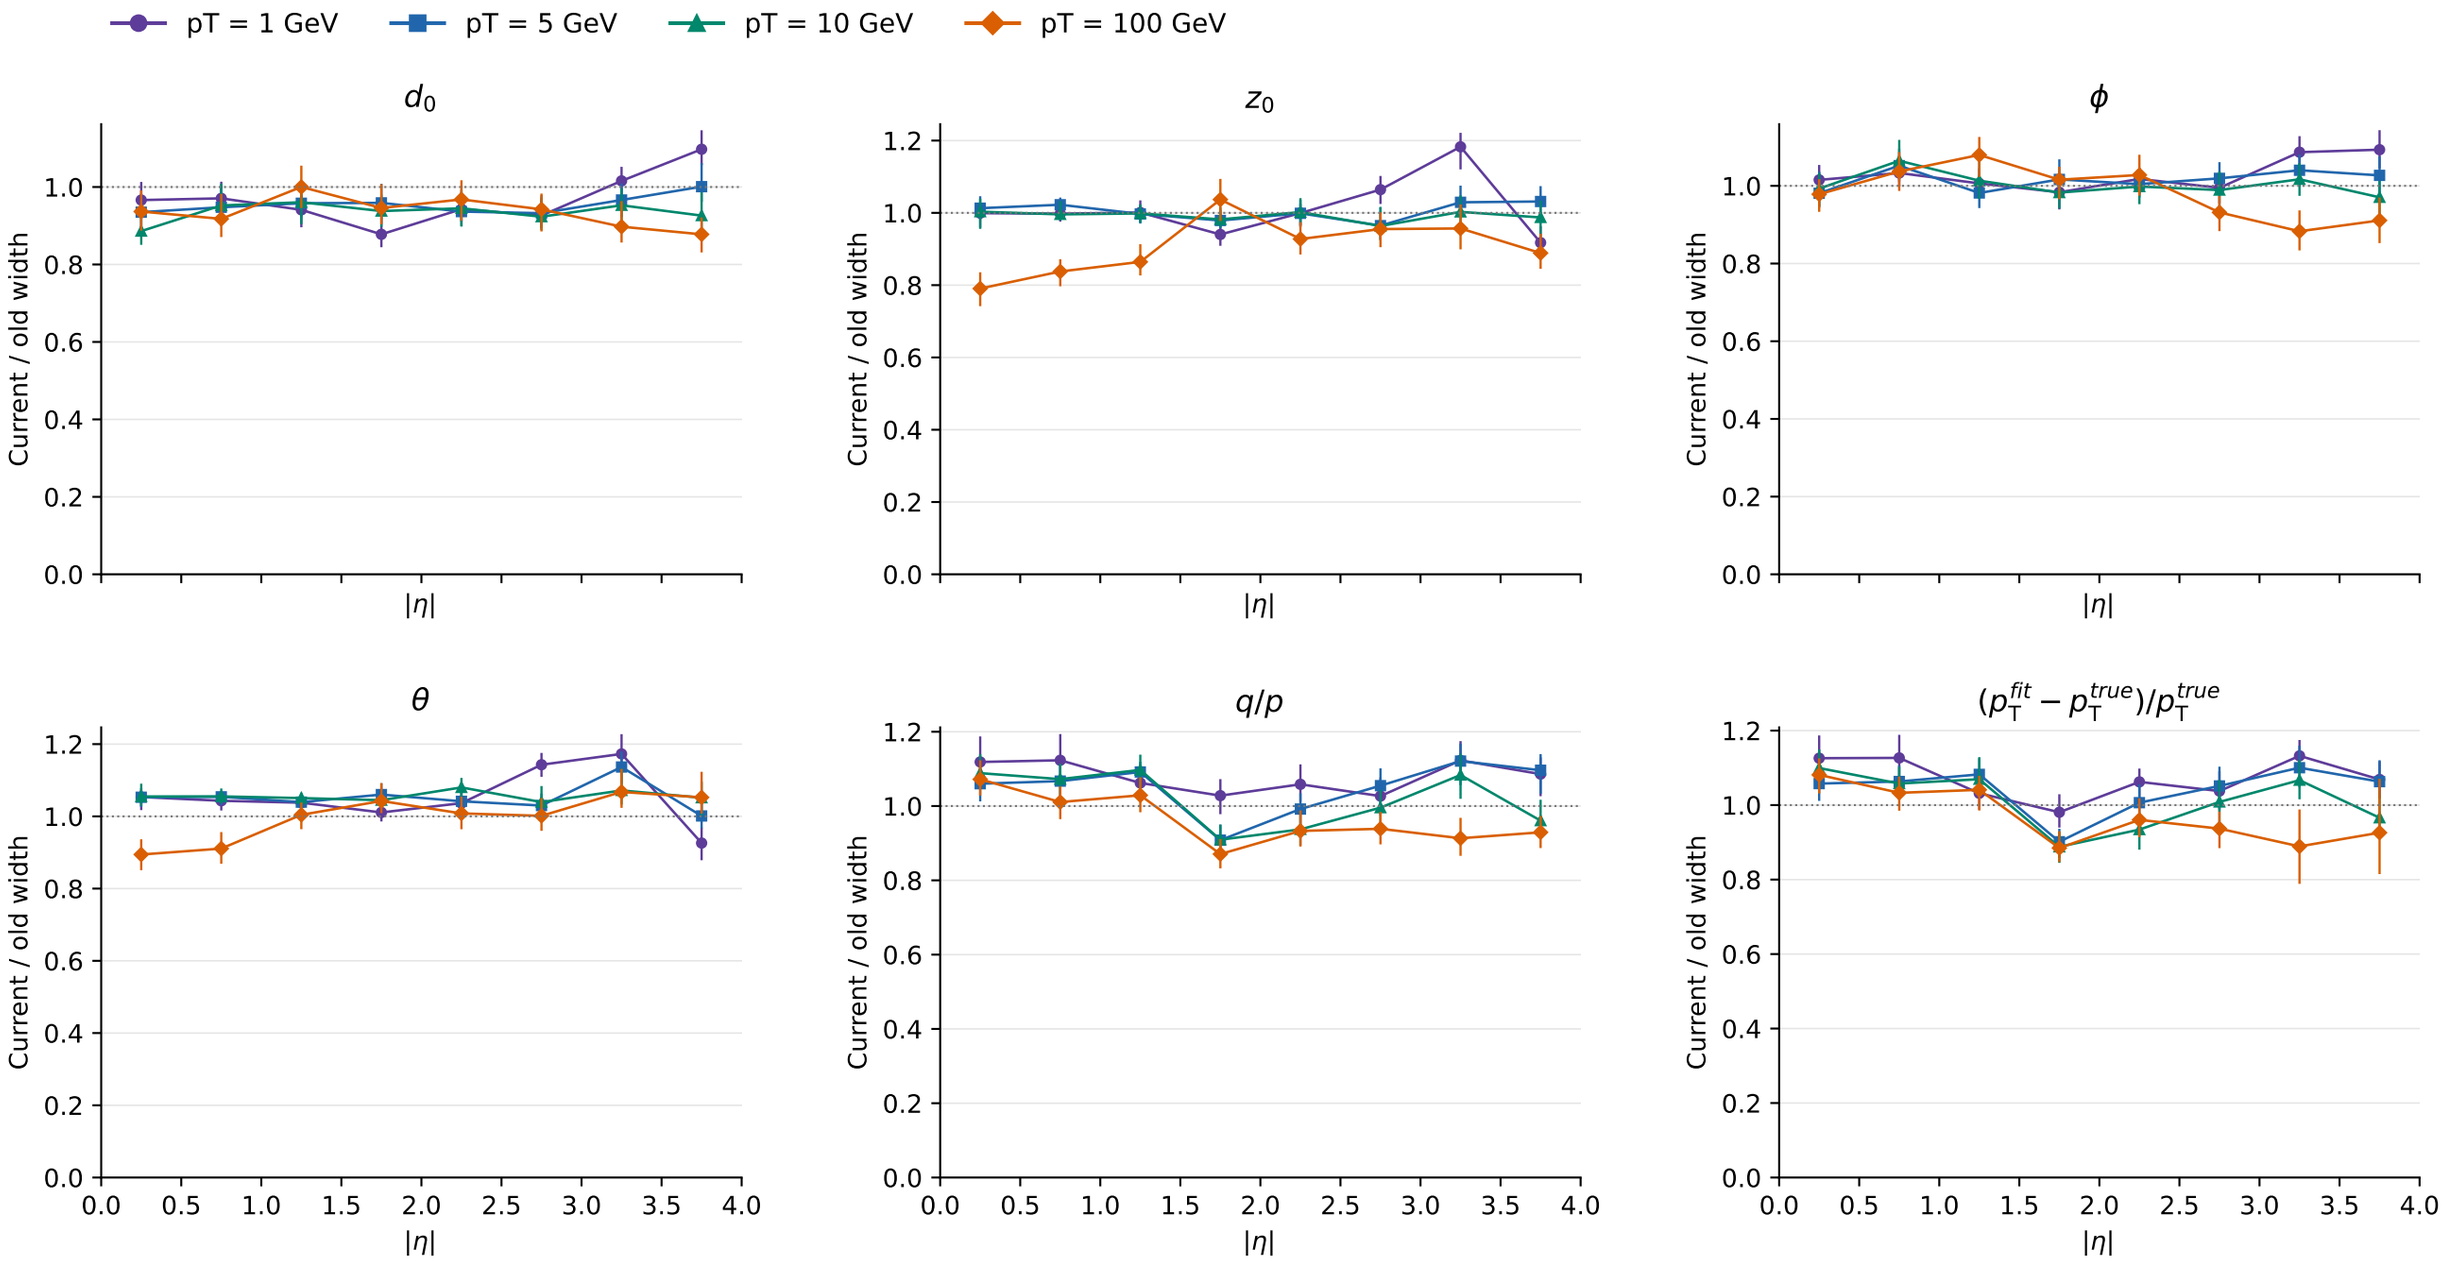
New / old track-parameter resolution

Fatras truth tracking · ratio of central 68.27% half-widths · paired generated-event bootstrap, pointwise 95% intervals



Below 1: narrower fitted core; above 1: wider fitted core. Each baseline retains its own missing-fit outcomes when resampling paired events.

Whole baseline comparison: geometry, material and 0.5→2 mm short-strip response change together. Sampling errors omit model/calibration systematics.
