

Separate extraction model | cable bundles and grouped CO₂ pairs

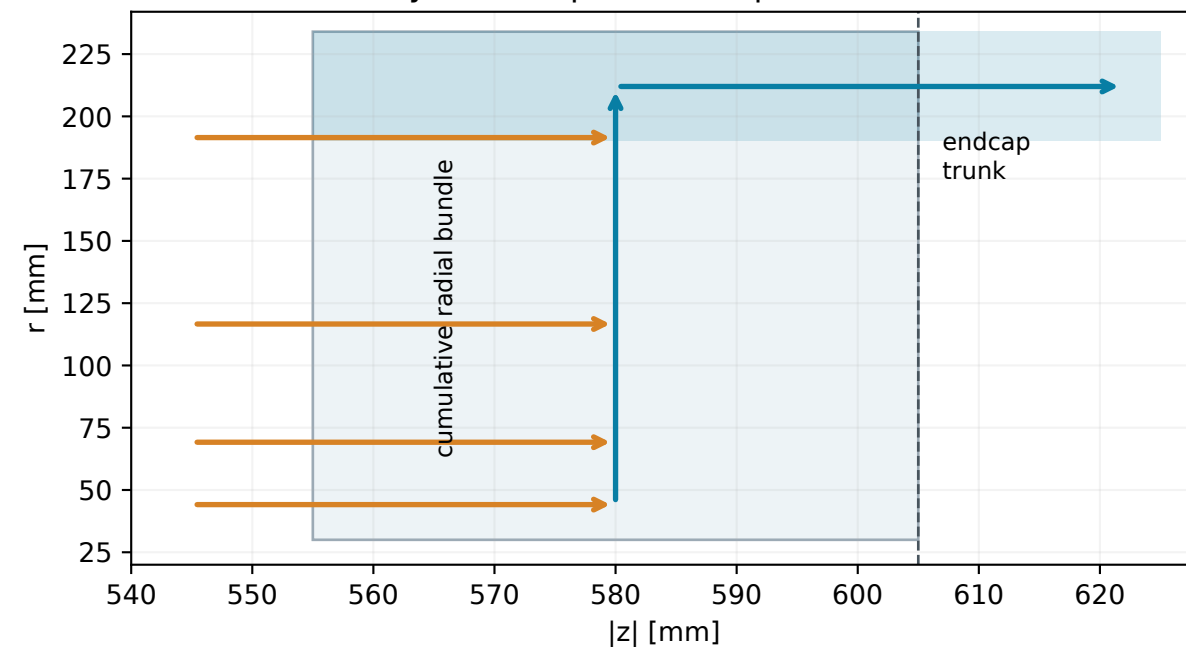

Existing radial bay |z| = 555-605 mm → axial annulus r = 190-234 mm

+z bay, viewed along beam

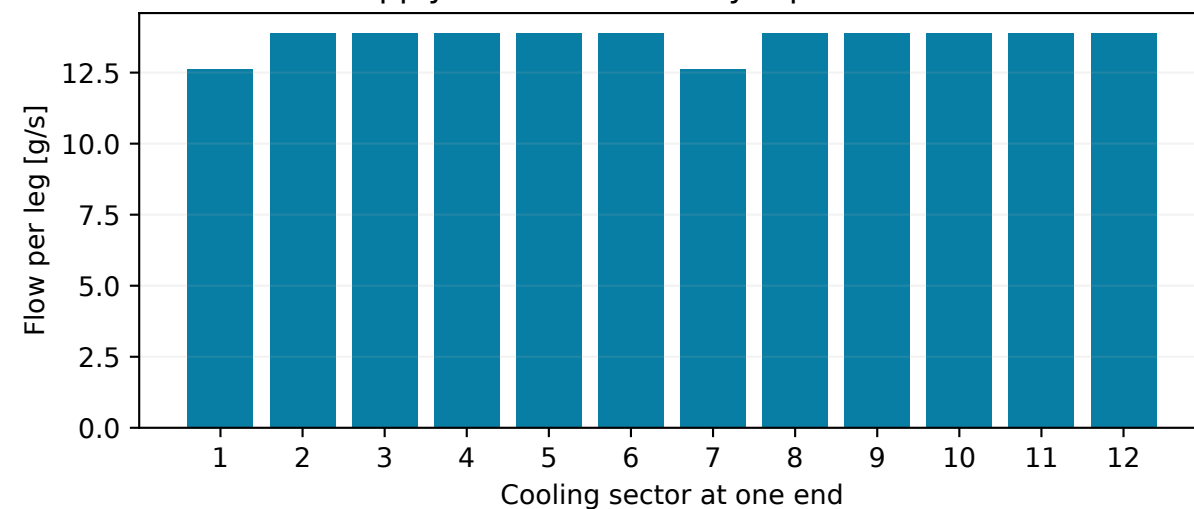

12 sector pairs; coloured arcs collect actual stave populations

Radial bay → outer pixel endcap trunk (schematic)

Supply and exhaust carry equal total flow

PROTOTYPE topology: each blue radial line represents ONE supply + ONE exhaust, not a single pipe. Both ends use the same 12-sector partition. Cable ribbons share the sector corridors; bends/manifold detail omitted. Downstream endcap pickups stay in DES-010 and are not replaced.
